

WG20

Geared Motors up to 4500 Nm

Technical Catalogue

WEG Group - Transforming energy into solutions.

WEG is a leading global manufacturer and solutions provider of drive technology, energy production and distribution, and automation systems and switchgear construction.

Founded in Brazil in 1961 by three entrepreneurs, WEG has grown to become one of the most important global manufacturers of electric motors. WEG has more than 30,000 employees around the world. The annual turnover of around 3 billion euro reflects its increasing success. The company's global presence is supported by branches in 29 countries, production facilities, and a network of authorised dealers on all five continents.

Your requirements - our expertise

As one of the leading global manufacturers and solutions providers of drive technology, WEG's aim was to expand its extensive range of products by gear units produced in its own facilities. Perfect coordination of products throughout the drive train has put WEG in a position to offer customers even more superior and efficient solutions.

Under the leadership of Watt Drive, the challenge was to develop a program which not only meets the current demands of the market, but also satisfied WEG's high quality requirements. The Group's own centre of excellence for geared motors in Austria, part of the WEG Group since 2011, can draw on more than 40 years of experience in development, production and sales of gear units and geared motors.

In order to satisfy the requirements of state-of-the-art geared motors the following market requirements were taken into account during the development phase:

Standard mounting dimensions

For users, the aim was to make the new range of geared motors as easy and effortless to use as possible. To ensure installation in an existing system or production line worked effortlessly without incurring unnecessary costs for conversions, the developers decided to adapt the

mounting dimensions of the new gear units to products already established on the market. The objective: worldwide, easy and cost-effective interchangeability.

Torque transmission

The gear units needed to be compact, efficient, robust and reliable. In order to achieve this goal a transmission had to be designed which allows large ratio ranges in a two-stage model while being able to integrate easily into the new design gear housing.

Efficiency

Energy efficiency has always been of paramount importance to WEG. The aim here was to live up to this demand when designing the new WG20 geared motors. This requires the perfect interaction of sophisticated technology and exclusive use of high quality components.

Worldwide use

To meet the requirements of global mechanical and plant engineering, it was vital that the new geared motors can be used worldwide, whilst maintaining a high level of flexibility for applications.

The solution is **WG20**.

www.cat4cad.com

Easy **product selection**

The “cat4CAD®” product configuration tool makes it easy to interactively select products. Comprehensive wizards, user-friendly navigation and many other extra features allow quick configuration of the required drive.

Advantages

- Extensive product library
- Fast configuration of motors and geared motors
- Creation of project files with comprehensive technical documentation
- Easy modification of generated product data by means of the project file
- Quick request times

Features

- The entire menu is available in many languages.
- To-scale 2D/3D drawings and PDF and DXF dimension sheet drawings of the previously selected drive.
- The 2D/3D data can be exported for use in standard CAD programs.
- Comprehensive technical data sheets of the configured gear unit and motor at the click of a button.
- The project file allows complete management of previously selected drives on one screen.
At the click of a button one can save or print this project file, create PDF and DXF dimension drawings, and send enquiries directly to our sales team.

Online version available at www.cat4cad.com

Offline version for download at www.wattdrive.com

WG20 - Geared motors up to 4500 Nm

WG20 is the first geared motor range to be completely developed in-house at WEG. The second stage of extension comprises helical, parallel shaft and helical bevel gear units with torques between 50 and 4500 Nm. Already the two-stage units excel with their large ratio range, as well as being exceptionally efficient thanks to the sophisticated design. The light aluminium housings of the gear units up to 600 Nm and the robust cast iron housings from 800 Nm provide a highly versatile and reliable product, with a wide range of possible applications.

WG20's final stage of extension will feature geared motors up to 18,000 Nm.

Helical geared motors C

Nominal torque: 50 - 4500 Nm

Power range: 0.12 - 30 kW

Ratio range: 2.44 - 375.71

Parallel shaft geared motors F

Nominal torque: 130 - 4500 Nm

Power range: 0.12 - 30 kW

Ratio range: 3.85 - 487.67

Helical bevel geared motors K

Nominal torque: 110 - 4500 Nm

Power range: 0.12 - 30 kW

Ratio range: 3.82 - 277.79

This catalogue contains information (descriptions and characteristics), which do not always apply as described in case of actual use. Data can also change due to product development. Characteristics are only binding if explicitly agreed to in the contract. Delivery opportunities and technical modifications subject to change without notice.

Drive calculation

1. Drive power

The required total power is divided into static and dynamic components. The static power is the component at constant speed (friction and lifting force). The dynamic component is the power for accelerating and decelerating of masses.

The selected rated motor power (P_N) must be bigger than the required static drive power. The required total power can be bigger than the rated motor power but it must be smaller than the maximum motor power.

	Formula	Unit
Output speed of the gear unit	$n_2 = \frac{v \cdot 30}{\pi \cdot r}$	[min ⁻¹]

Static drive power		
Linear movement Horizontal movement (conveyor, travel drive)	$P_{\text{stat}} = \frac{m \cdot g \cdot \mu \cdot v}{1000 \cdot \eta}$	[kW]
Inclined movement (inclined conveyor, travel drive with inclination)	$P_{\text{stat}} = \frac{m \cdot g \cdot v \cdot (\sin \alpha + \mu \cdot \cos \alpha)}{1000 \cdot \eta}$	[kW]
Vertical movement (lifting drive, hoist, bucket elevator)	$P_{\text{stat}} = \frac{m \cdot g \cdot v}{1000 \cdot \eta}$	[kW]
Static output torque	$M_{2\text{stat}} = \frac{P_{\text{stat}} \cdot 9550}{n_2}$	[Nm]

Dynamic drive power (acceleration/deceleration power)		
Horizontal movement	$P_{\text{dyn,A,(B)}} = \frac{m \cdot v^2}{1000 \cdot t_{\text{A,(B)}} \cdot \eta}$	[kW]
Rotary motion	$P_{\text{dyn,A,(B)}} = \frac{\Sigma J_{\text{red.}} \cdot n_1^2}{9,12 \cdot 10^4 \cdot t_{\text{A,(B)}} \cdot \eta}$	[kW]
Starting resp. braking time	$t_{\text{A,(B)}} = \frac{\Sigma J_{\text{red.}} \cdot n_1}{9,55 \cdot (M_{\text{A,(B)}} \pm M_L)}$	[s]
Minimum starting time against slipping	$t_{\text{Amin}} = \frac{v}{\mu_0 \cdot g}$	[s]
Load torque of motor	$M_L = \frac{M_{2\text{stat}}}{i}$	[Nm]
Starting power	$P_A = P_{\text{dyn,A}} + P_{\text{stat}}$	[kW]
Braking power	$P_B = P_{\text{dyn,B}} \pm P_{\text{stat}}$	[kW]
Starting / braking torque	$M_{2,\text{A,(B)}} = \frac{P_{\text{A,(B)}} \cdot 9550}{n_2}$	[Nm]

+ M_L for braking when the load acts braking (e.g. lifts when going up)

- M_L for starting or for braking when the load acts accelerative (e.g. lifts when going down)

Mass moments of inertia

External load moments of inertia have to be reduced onto the motor shaft by squared ratios.

Reduced mass moment of inertia	$J_{\text{ex.red.}} = \frac{J_{\text{ex.}}}{i^2}$	[kgm ²]
Solid cylinder 	$J_{\text{ex.red.}} = 98,2 \cdot \rho \cdot l \cdot d_a^4 \cdot \left(\frac{n_x}{n_1}\right)^2$	[kgm ²]
Hollow cylinder 	$J_{\text{ex.red.}} = 98,2 \cdot \rho \cdot l \cdot (d_a^4 - d_i^4) \cdot \left(\frac{n_x}{n_1}\right)^2$	[kgm ²]
Linear movement 	$J_{\text{ex.red.}} = 91,2 \cdot m \cdot \left(\frac{v}{n_1}\right)^2$	[kgm ²]

Approximate values for friction coefficients:

Rolling friction: $\mu_r = 0.005 - 0.02$ steel/steel
 $\mu_r = 0.02 - 0.06$ plastic/steel
 $\mu_r = 0.06 - 0.2$ rubber/steel

Static friction: $\mu_0 = 0.15$ steel/steel

Friction coefficient for conveyors:

$\mu_r = 0.13$ 10 m conveyor length
 $\mu_r = 0.08$ 25 m conveyor length
 $\mu_r = 0.06$ 50 m conveyor length
 $\mu_r = 0.05$ 100 m conveyor length

Designation	Unit	Description
d_a	[m]	Outside diameter
d_i	[m]	Inside diameter
f_B		Service factor
F_I		Inertial factor
g	[m/s ²]	Acceleration due to gravity
i		Gear ratio
$J_{\text{ex.red.}}$	[kgm ²]	All external mass moments of inertia corrected to motor input
$J_{\text{ex.}}$	[kgm ²]	All external mass moments of inertia
J_{mot}	[kgm ²]	Mass moment of inertia of the motor
$\Sigma J_{\text{red.}}$	[kgm ²]	Sum of all $J_{\text{red.}}$ values
l	[m]	Length
m	[kg]	Mass
$M_{2,A}$	[Nm]	Output torque of gear unit for starting
$M_{2,B}$	[Nm]	Output torque of gear unit for braking
$M_{2\text{Nenn}}$	[Nm]	Permissible output torque
$M_{2\text{stat}}$	[Nm]	Static output torque
M_A	[Nm]	Starting torque of the motor (see motor electric data sheets from page 257)
M_B	[Nm]	Brake torque

Designation	Unit	Description
M_L	[Nm]	Load torque of motor
n_1	[min ⁻¹]	Input speed (motor speed)
n_2	[min ⁻¹]	Output speed (gear unit)
n_x	[min ⁻¹]	Speed of calculated components
P_A	[kW]	Power of gear unit at start
P_B	[kW]	Power of gear unit at stop
P_{stat}	[kW]	Static power
$P_{\text{dyn,A}}$	[kW]	Dynamic acceleration power
$P_{\text{dyn,B}}$	[kW]	Dynamic deceleration power
r	[m]	Sprocket / roller radius
t_{Amin}	[s]	Minimum starting time with risk of slip
t_A	[s]	Starting time
t_B	[s]	Braking time
v	[m/s]	Linear velocity
α	[°]	Angle of inclination
η		Efficiency of the gear unit, system
μ		Coefficient of friction
μ_0		Coefficient of static friction
μ_r		Coefficient of rolling friction
ρ	[kg/dm ³]	Density (steel=7.85 kg/dm ³)

2. Load types

Load type A	Load type B	Load type C
Uniform load, small masses to be accelerated, no shocks	Non-uniform load, medium masses to be accelerated, medium shocks	Extremely rough conditions, high masses to be accelerated, heavy shocks and alternating load
Examples: Continuous conveyor for bulk goods, light conveyors, blowers, centrifugal pumps, light elevators, screw conveyors, fluid agitators	Examples: Bucket conveyors, rotary furnaces, printing and dyeing machines, conveyor drums, centrifugal pumps and semi- fluid good agitators, wood working machines, elevators, screw conveyors, concrete mixers	Examples: Ramming machines, calenders, duty rolling mills, presses, heavy mixer, stone crushers, shredders, heavy winches and lifts

3. Service factor

The gear unit required can be selected from the following tables showing the power, torque and output speed options. All our gear units are adequately dimensioned for long-life industrial applications and are designed for continuous loading under uniform operating conditions with small masses to be accelerated. Operating times of 8-10 hours a day are considered standard. No drive can be built to withstand all possible conditions, therefore the load conditions at the site have to be determined accurately and the proper load type identified. After determining the daily operating hours, selecting the type and establishing the number of starts (c/h), see the following diagram to find out the necessary service factor f_B . The inertial factor F_I assists in evaluating and attributing the masses to be accelerated. The service factor given in the tables indicates the reserve load in the rated torque for the specific gear unit.

In the tables you can usually choose between two types of gear units with the same or similar speeds, but different service factors. When you select the correct gear unit, the f_B from the diagram below should always be less than or equal to the available f_B (from the selection tables) for the chosen type. For short time operation, you can sometimes select a smaller gear unit, while for peak operation, a large number of starts or 24-hour continuous operation, a larger type is necessary. The output speed figures shown in the selection tables have been rounded up or rounded off. They may however vary due to the motor size and are valid for nominal load. Deviations of +/- 3 % are permissible.

	Formula	Unit
Service factor	$f_B = \frac{M_{2Nenn}}{M_{2stat}}$	
Inertial factor	$F_I = \frac{\Sigma J_{ex.red} + J_{mot}}{J_{mot}}$	$[min^{-1}]$

Modes of operation DIN EN 60034-1 see page 251.

Legend see page 9.

Thermal power limit

The thermal power limit P_t must always be taken into account when designing a drive. It represents the maximum input power which can be transmitted by the gear unit at the given ambient temperature in a continuous operation mode (S1).

The technical data of the geared motors shown in the selection tables apply to an ambient temperature of +20 °C. Thermal power limits for other temperatures can be seen in the table below.

Parameters to be considered:

- Higher / lower temperatures
- Vertical mounting positions (M2 or M4)
- Higher speed (> 1500 rpm) due to e.g. use of frequency inverter
- Small ratios
- Little mounting space

For such conditions we recommend consulting WEG. The geared motors can be adapted according to customer requirements by using e.g. lubricant expansion, optimised oil quantities, synthetic oils or Viton seal rings.

Gear size	Ambient temperature								
	-20 °C	-10 °C	0 °C	+10 °C	+20 °C	+30 °C	+40 °C	+50 °C	+60 °C

Painting

Standard colour geared motors: RAL 7011 (RAL 5009, RAL 9005 and RAL 9007 without additional costs)

In addition to the standard high-grade polyurethane-based surface finish other special finishes for applications that are subject to specific environmental conditions are offered. Paintwork is basically categorised according to the composition of the applied surface finish. The standard program contains 6 painting systems categorised from LA0 to LC5. Special colours are possible.

Painting system	Application	Layering	NDFT Nominal dry film thickness	Temperature range	Corrosion category DIN EN ISO 12944-5
not painted					
LA0	Primer	Dip primer Base coat (2 pack PUR)		-40 °C - +120 °C	
LC1 (Standard)	Indoor installation, neutral atmosphere	Dip primer Varnish (2 pack PUR)	60 µm	-40 °C - +120 °C	C1
LC2	Protected outdoor installation, neutral atmosphere	Dip primer 2x Varnish (2 pack PUR)	140 µm	-40 °C - +120 °C	C2
LC3	Outdoor installation, industrial atmosphere	Dip primer Base coat (2 pack PUR) Varnish (2 pack PUR)	160 µm	-40 °C - +120 °C	C3
LC4	Outdoor installation, aggressive atmosphere	Dip primer Base coat (2 pack PUR) Intermediate base coat (2 pack PUR) Varnish (2 pack PUR)	240 µm	-40 °C - +120 °C	C4
LC5	Coast or offshore, very aggressive atmosphere, under water	Dip primer Base coat (2 pack PUR) Intermediate base coat (2 pack PUR) Varnish (2 pack PUR)	320 µm	-40 °C - +120 °C	C5-I/C5-M

Degrees of protection

Degree of protection according to DIN EN 60034-5.

The designation to indicate the degrees of protection consists of the characteristic letters IP followed by two numerals.

Code figure 1: degree of protection against contact with live or moving parts and against ingress of solid foreign objects

Code figure 2: degree of protection against harm for ingress of water

Degree of protection:

Modular system motor: IP55 (standard) to IP67

Brake: IP55 (standard) to IP66

Gear unit: IP65 (standard) to IP68

Code figure 1	
	Description
0	No protection
1	Protected against solid foreign objects of 50 mm diameter and larger: the probe (50 mm ball) may not fully penetrate.
2	Protected against solid foreign objects of 12.5 mm diameter and larger: the probe (ball 12.5 mm) shall not fully penetrate.
3	Protected against solid foreign objects of 2.5 mm diameter: the probe (ball 2.5 mm) must not penetrate at all.
4	Protected against solid foreign objects of 1 mm and larger: the probe (1 mm ball) must not penetrate at all.
5	Dust protected: ingress of dust is not totally prevented, but dust shall not penetrate in a quantity that the operation of the device is affected or to impair safety.
6	Dustproof: no ingress of dust at underpressure of 20 mbar in the housing

Code figure 2	
	Description
0	No protection
1	Protected against dripping water: vertically falling drops may not have any harmful effects.
2	Protected against dripping water when the housing is inclined up to 15°: vertically falling drops may not have any harmful effects when the housing is inclined up to 15° from the vertical.
3	Protected against water spray: water sprayed at an angle up to 60° on both sides of the vertical may not have any harmful effects.
4	Protected against splash water: water splashed against the housing from any direction may not have any harmful effects.
5	Protected against water jets: water that is from any direction in jets against the housing may not have any harmful effects.
6	Protected against strong water jets: water that is from any direction in powerful jets against the housing may not have any harmful effects.
7	Protected against the effects of temporary immersion in water: water must not enter in quantities causing harmful effects, if the housing is under standardised conditions of pressure and time temporarily submerged in water.
8	Protected against the effects of continuous immersion in water: water must not enter in quantities causing harmful effects when the enclosure is permanently submerged in water under conditions to be agreed between manufacturer and user. The conditions must be more stringent than for index.

Helical geared motors C

Technical Data

Size	C00	C01	C03	C05	C06	C07	C08	C09	C10
Power	0.12 - 0.75 kW	0.12 - 1.5 kW	0.12 - 3 kW	0.12 - 7.5 kW	0.12 - 9.2 kW	0.12 - 15 kW	0.18 - 22 kW	0.55 - 30 kW	1.1 - 30 kW
Torque	50 Nm	85 Nm	200 Nm	400 Nm	600 Nm	820 Nm	1550 Nm	3000 Nm	4500 Nm
Ratio	2.44 - 47.44	3.09 - 66.5	3.34 - 286.32	3.83 - 328.43	3.73 - 375.71	5.30 - 351.33	5.12 - 368.94	4.22 - 306.73	4.19 - 246.43
Number of stages	2	2	2 / 3	2 / 3	2 / 3	2 / 3	2 / 3	2 / 3	2 / 3
Housing material		aluminium				cast iron			
Solid shaft	Type	with key acc. to DIN 6885.1 and threaded bore acc. to DIN 332 sheet 2							
	Tolerance	< Ø 55: k6 / ≥ Ø 55: m6							
	Material	standard: C45E (1.1191) / stainless steel on request							
Flanges	Tolerance	centring ≤ 250: j6 / > 250: h6 acc. to DIN EN 50347							
	Material	cast iron							
Gear wheels	Type	honed							
	Material	16MnCr5 (1.7131) case hardened – minimum 58HRC							
Shaft seals	Type	type AS acc. to DIN 3760							
	Material	standard NBR / special FKM							
Bearing		standard / reinforced							
Lubricants	Type	standard CLP 220 / special CLP HC 220							
	Quantity	depending on mounting position							
Axle height		acc. to DIN 747: ≤ 50: -0.4; > 50 to ≤ 250: -0.5; > 250: -1 for foot-mounted geared motors, the motor may extend below the mounting surface							

General information

1. Nameplate

a	Type code	i	Production date
b	Motor power	j	Serial number
c	Output torque	k	Material number
d	Service factor	l	Output speed
e	Type and quantity of lubricant	m	QR-Code linked online to additional information
f	Space for additional information	n	Total gear ratio
g	Manufacturer address	o	Mounting position
h	Country of origin	p	Weight

2. Type code

CG083-11P-90S/L-04F ...

1 2 3 4 5 6 7 8 9

1	Type:	C = Helical gear unit
2	Design:	A = Foot mounted and B5 flange execution with output shaft C = B14 flange execution with output shaft F = Flange execution with output shaft G = Foot mounted with output shaft W = Foot mounted and B14 flange execution with output shaft
3	Size:	00 01 03 05 06 07 08 09 10
4	Number of stages:	2 = 2 gear stages 3 = 3 gear stages
5	Motor type:	11N = Integral motor aluminium IE1 11P = Integral motor aluminium IE3 22P = Integral motor cast iron IE3
6	Motor frame size:	63 71 80 90S/L 100L L100L 112M 132S 132M L132M 160M 160L 180M 180L 200L
7	Number of poles:	04 = 4 poles 06 = 6 poles
8	Power indicator:	D E F G
9	Motor modules:	see from page 271

3. Range

Size	C00	C01	C03	C05	C06	C07	C08	C09	C10
Housing material	Aluminium					Cast iron			

4. Design

	A	Foot mounted and B5 flange execution with output shaft
	C	B14 flange execution with output shaft
	F	Flange execution with output shaft
	G	Foot mounted with output shaft
	W	Foot mounted and B14 flange execution with output shaft

5. Venting the gear unit

The helical gear unit sizes C00 to C06 are neither equipped with a venting nor an oil drain screw. They are supplied with lifetime-lubrication.

By default, the helical gear units C07 to C10 are equipped with venting screws with a safety strap for transportation (see illustration). The rubber strap (a) of the venting screw must be removed entirely before the initial startup. The venting screw is placed accordingly to the mounting position (see chapter Mounting positions, page 22).

6. Overhung and axial loads

The overhung loads (F_{HN}) indicated in the respective selection tables apply to gear units with the force acting on the shaft center ($x=l/2$). The permissible overhung loads listed are based on the least favourable loading direction and calculated for standard shafts and standard bearings. Other load directions and action can be calculated with equations Q1 to Q3. If transmission elements are placed on the output shaft, an appropriate factor (f_z) has to be taken into consideration when determining the overhung load.

Gear wheels	Sprockets		V-belts	Flat belts
				
$f_z=1.1$ ($z \leq 17$)	$f_z=1.2$ ($z \leq 13$)	$f_z=1.1$ ($z > 13$)	$f_z=1.8$	$f_z=2.5$

Use the following equations Q1 and Q2 to calculate the permissible radial loads on the output shaft. Q3 is to calculate the real existing shaft loads for your application. The results are to be compared by using the equation Q4.

Q1	$F_{zL} = F_{rN} \cdot a_1$
Q2	$F_{zW} = F_W \cdot a_2$
Q3	$F_{Qvorh} = \frac{2 \cdot M_2}{d_0} \cdot f_z$
Q4	$F_{Qvorh} \leq F_{zL}$
	$F_{Qvorh} \leq F_{zW}$

Variable	Unit	Description
a1		Load action factor - output shaft bearing from table 1
a2		Load action factor - output shaft from table 1
d0	[m]	Effective diameter of the transmission element
M2	[Nm]	Geared motor output torque (from selection tables) or required calculated output torque
FzL	[N]	Permissible overhung load for output shaft bearings
FzW	[N]	Permissible overhung load for output shaft
FrN	[N]	Permissible overhung load from selection tables
FW	[N]	Permissible overhung load - Output shaft x=l/2 from table 2
FQvorh	[N]	Existing overhung load at gear shaft
fz		Factor for transmission element
Mmax	[Nm]	Highest possible output torque for coupling operation (table 2)

Always use both equations Q1 and Q2 for your calculations.

x / l						
0	0.25	0.5	0.75	1	1.5	2
a1 → Equation Q1						
1.39	1.18	1.00	0.85	0.73	0.52	0.38
a2 → Equation Q2						
2.00	2.00	1.00	0.55	0.38	0.23	0.17

Table 1: Load action factors a1, a2

Intermediate values can be interpolated linearly. Combined load ($F_r \neq 0$; $F_a = 0$) on request.

	Mmax at Fr = 0	Output torque M2 [Nm]												
		50	100	200	300	400	600	820	1550	3000	4500	8000	13000	18000

Ø 60x120	3740							31.0	30.0	23.0				
Ø 70x140	5850								44.0	41.0	36.0			
Ø 90x170	11700									72.0	70.0	61.0		
Ø 110x210	20800										106.0	103.0	93.0	
Ø 120x210	26700											129.0	121.0	109.0

Table 2: Permissible overhung load - output shaft x = l/2

In cases where there is no overhung load, the permissible axial load (push or pull) may be determined by taking 50 % of the permissible overhung loads indicated in the selection tables of the respective type of gear. If there are axial loads or radial and axial components acting on the drive which are extraordinarily high, we recommend to contact the manufacturer.

7. Mounting positions, Position of the terminal box and Cable entry

Mounting positions foot type - Sizes C00 to C06

Gear units C00 to C06 are not ventilated and supplied with lifetime lubrication.

Position of the terminal box

Standard: Position 1

Cable entry

Standard: Position I

Mounting positions flange type - Sizes C00 to C06

Gear units C00 to C06 are not ventilated and supplied with lifetime lubrication.

Position of the terminal box

Standard: Position 1

Cable entry

Standard: Position I

Mounting positions foot type - Sizes C07 to C10

 Position of the venting screw

 Position of the oil drain screw

Position of the terminal box

Standard: Position 1

Cable entry

Standard: Position I

Mounting positions flange type - Sizes C07 to C10

Position of the venting screw

Position of the oil drain screw

Position of the terminal box

Standard: Position 1

Cable entry

Standard: Position I

Selection tables - Geared motors

The technical data of the geared motors shown in the selection tables apply to an ambient temperature of +20 °C.

The selection tables are calculated with following motor data:

Power (IEC frame size)	Motor series (IE class)
up to 0.55 kW (63 - 80)	11N (IE1) - aluminium
0.75 - 9.2 kW (80 - 132)	11P (IE3) - aluminium
11 - 30 kW (160 - 200)	22P (IE3) - cast iron

Structure of the selection tables

1						2				
P_N = 0.12 kW						IE1				
50 Hz	60 Hz				at 50 Hz				m kg	Dimension sheet see page
0.12 kW	0.14 kW *)									
n₅₀ min ⁻¹	n₆₀ min ⁻¹	M₂ Nm	f_B	i	F_{rN} kN					
3	4	5	6	7	8	9			10	11

- 1 Rated power of the motor
- 2 Given values are based on the respective efficiency class
- 3 Output speed at 50 Hz
- 4 Output speed at 60 Hz
- 5 Output torque
- 6 Service factor
- 7 Total ratio
- 8 Permissible radial load at midpoint of the output shaft extension (standard bearing) at axial load=0
- 9 Geared motor type
- 10 Weight
- 11 Dimension sheet see page

*) Increased rated power at 60 Hz can only be reached together with increased voltage within the wide range (for details see page 254).

Increased rated power
1.2 x P _N

- 1** Type of gear unit
- 2** Total ratio
- 3** Permissible output torque at S1 operation ($f_b = 1.0$)
- 4** Output speed (gear unit) at $n_1 = 1400\text{ min}^{-1}$
- 5** Exact mathematical ratio
- 6** Possible motor frame sizes
- 7** Number of gear stages
- 8** Motor speed
- 9** Maximum torque

5. Venting the gear unit

The parallel shaft gear unit sizes F02 to F05 are neither equipped with a venting nor an oil drain screw. They are supplied with lifetime-lubrication.

By default, the parallel shaft gear units F06 to F09 are equipped with venting screws with a safety strap for transportation (see illustration). The rubber strap (a) of the venting screw must be removed entirely before the initial startup. The venting screw is placed accordingly to the mounting position (see chapter Mounting positions, page 105)

6. Overhung and axial loads

The overhung loads (F_{rN}) indicated in the respective selection tables apply to gear units with the force acting on the shaft center ($x=l/2$). The permissible overhung loads listed are based on the least favourable loading direction and calculated for standard shafts and standard bearings. Other load directions and action can be calculated with equations Q1 to Q3. If transmission elements are placed on the output shaft, an appropriate factor (f_z) has to be taken into consideration when determining the overhung load.

Gear wheels	Sprockets		V-belts	Flat belts
				
$f_z=1.1$ ($z \leq 17$)	$f_z=1.2$ ($z \leq 13$)	$f_z=1.1$ ($z > 13$)	$f_z=1.8$	$f_z=2.5$

Use the following equations Q1 and Q2 to calculate the permissible radial loads on the output shaft. Q3 is to calculate the real existing shaft loads for your application. The results are to be compared by using the equation Q4.

Q1 $F_{zL} = F_{rN} \cdot a_1$

Q2 $F_{zW} = F_W \cdot a_2$

Q3 $F_{Qvorh} = \frac{2 \cdot M_2}{d_0} \cdot f_z$

Q4 $F_{Qvorh} \leq F_{zL}$
 $F_{Qvorh} \leq F_{zW}$

Variable	Unit	Description
a1		Load action factor - output shaft bearing from table 1
a2		Load action factor - output shaft from table 1
d0	[m]	Effective diameter of the transmission element
M2	[Nm]	Geared motor output torque (from selection tables) or required calculated output torque
FzL	[N]	Permissible overhung load for output shaft bearings
FzW	[N]	Permissible overhung load for output shaft
FrN	[N]	Permissible overhung load from selection tables
FW	[N]	Permissible overhung load - Output shaft x=l/2 from table 2
FQvorh	[N]	Existing overhung load at gear shaft
fz		Factor for transmission element
Mmax	[Nm]	Highest possible output torque for coupling operation (table 2)

Always use both equations Q1 and Q2 for your calculations.

x / l						
0	0.25	0.5	0.75	1	1.5	2

Ø 120x210	26700											129.0	121.0	109.0

Table 2: Permissible overhung load - output shaft x = l/2

In cases where there is no overhung load, the permissible axial load (push or pull) may be determined by taking 50 % of the permissible overhung loads indicated in the selection tables of the respective type of gear. If there are axial loads or radial and axial components acting on the drive which are extraordinarily high, we recommend to contact the manufacturer.

7. Mounting positions, Position of the terminal box and Cable entry

Mounting positions - Sizes F02 to F05

Gear units F02 to F05 are not ventilated and supplied with lifetime lubrication.

Position of the terminal box

Selection tables - Geared motors

The technical data of the geared motors shown in the selection tables apply to an ambient temperature of +20 °C.

The selection tables are calculated with following motor data:

Power (IEC frame size)	Motor series (IE class)
up to 0.55 kW (63 - 80)	11N (IE1) - aluminium
0.75 - 9.2 kW (80 - 132)	11P (IE3) - aluminium
11 - 30 kW (160 - 200)	22P (IE3) - cast iron

Structure of the selection tables

1										2	
$P_N = 0.12 \text{ kW}$										IE1	
50 Hz	60 Hz					at 50 Hz					
0.12 kW	0.14 kW *)										
n_{50}	n_{60}	M_2	f_B	i	F_{rN}				m	Dimension sheet see page	
min^{-1}	min^{-1}	Nm			kN				kg		
3	4	5	6	7	8	9			10	11	

- 1 Rated power of the motor
- 2 Given values are based on the respective efficiency class
- 3 Output speed at 50 Hz
- 4 Output speed at 60 Hz
- 5 Output torque
- 6 Service factor
- 7 Total ratio
- 8 Permissible radial load at midpoint of the output shaft extension (standard bearing) at axial load=0
- 9 Geared motor type
- 10 Weight
- 11 Dimension sheet see page

*) Increased rated power at 60 Hz can only be reached together with increased voltage within the wide range (for details see page 254).

		[Nm]	[min ⁻¹]		63	71	80	90	100	112	132	160	180	200
F022	97.85	130	14	1957/20										
2 stages	7	88.09	130	16	969/11									
		76.22	130	18	3811/50									
n ₁ =1400 min ⁻¹	8	68.62	130	20	3774/55									
		61.80	130	23	309/5									
		55.64	130	25	612/11									
Maximum torque 130 Nm	9	48.69	130	29	2678/55									
		43.83	130	32	5304/121									
		37.52	130	37	5253/140									

- 1 Type of gear unit
- 2 Total ratio
- 3 Permissible output torque at S1 operation ($f_b = 1.0$)
- 4 Output speed (gear unit) at $n_1 = 1400\text{ min}^{-1}$
- 5 Exact mathematical ratio
- 6 Possible motor frame sizes
- 7 Number of gear stages
- 8 Motor speed
- 9 Maximum torque

P	B5 flange type with hollow shaft and shrink disc
S	Output shaft
T	Hollow shaft with torque arm
U	Hollow shaft with shrink disc and torque arm

5. Venting the gear unit

The helical bevel gear unit sizes K02 to K05 are neither equipped with a venting nor an oil drain screw. They are supplied with lifetime-lubrication.

By default, the helical bevel gear units K06 to K09 are equipped with venting screws with a safety strap for transportation (see illustration). The rubber strap (a) of the venting screw must be removed entirely before the initial startup. The venting screw is placed accordingly to the mounting position (see chapter Mounting positions, page 179)

6. Overhung and axial loads

The overhung loads (F_{rN}) indicated in the respective selection tables apply to gear units with the force acting on the shaft center ($x=l/2$). The permissible overhung loads listed are based on the least favourable loading direction and calculated for standard shafts and standard bearings. Other load directions and action can be calculated with equations Q1 to Q3. If transmission elements are placed on the output shaft, an appropriate factor (f_z) has to be taken into consideration when determining the overhung load.

Gear wheels	Sprockets		V-belts	Flat belts
				
$f_z=1.1$ ($z \leq 17$)	$f_z=1.2$ ($z \leq 13$)	$f_z=1.1$ ($z > 13$)	$f_z=1.8$	$f_z=2.5$

Use the following equations Q1 and Q2 to calculate the permissible radial loads on the output shaft. Q3 is to calculate the real existing shaft loads for your application. The results are to be compared by using the equation Q4.

Q1 $F_{zL} = F_{rN} \cdot a_1$

Q2 $F_{zW} = F_W \cdot a_2$

Q3 $F_{Qvorh} = \frac{2 \cdot M_2}{d_0} \cdot f_z$

Q4 $F_{Qvorh} \leq F_{zL}$
 $F_{Qvorh} \leq F_{zW}$

Variable	Unit	Description
a ₁		Load action factor - output shaft bearing from table 1
a ₂		Load action factor - output shaft from table 1
d ₀	[m]	Effective diameter of the transmission element
M ₂	[Nm]	Geared motor output torque (from selection tables) or required calculated output torque
F _{zL}	[N]	Permissible overhung load for output shaft bearings
F _{zW}	[N]	Permissible overhung load for output shaft
F _{rN}	[N]	Permissible overhung load from selection tables
F _W	[N]	Permissible overhung load - Output shaft x=l/2 from table 2
F _{Qvorh}	[N]	Existing overhung load at gear shaft
f _z		Factor for transmission element
M _{max}	[Nm]	Highest possible output torque for coupling operation (table 2)

Always use both equations Q1 and Q2 for your calculations.

x / l						
0	0.25	0.5	0.75	1	1.5	2
a ₁ → Equation Q1						
1.39	1.18	1.00	0.85	0.73	0.52	0.38
a ₂ → Equation Q2						
2.00	2.00	1.00	0.55	0.38	0.23	0.17

Table 1: Load action factors a₁, a₂

Intermediate values can be interpolated linearly. Combined load ($F_r \neq 0$; $F_a = 0$) on request.

	M _{max} at F _r = 0	Output torque M ₂ [Nm]												
		50	100	200	300	400	600	820	1550	3000	4500	8000	13000	18000

Ø 70x140	5850								44.0	41.0	36.0			
Ø 90x170	11700									72.0	70.0	61.0		
Ø 110x210	20800										106.0	103.0	93.0	
Ø 120x210	26700											129.0	121.0	109.0

Table 2: Permissible overhung load - output shaft x = l/2

In cases where there is no overhung load, the permissible axial load (push or pull) may be determined by taking 50 % of the permissible overhung loads indicated in the selection tables of the respective type of gear. If there are axial loads or radial and axial components acting on the drive which are extraordinarily high, we recommend to contact the manufacturer.

7. Mounting positions, Position of the terminal box and Cable entry

Mounting positions - Sizes K02 to K05

Gear units K02 to K05 are not ventilated and supplied with lifetime lubrication.

Position of the terminal box

Selection tables - Geared motors

The technical data of the geared motors shown in the selection tables apply to an ambient temperature of +20 °C.

The selection tables are calculated with following motor data:

Power (IEC frame size)	Motor series (IE class)
up to 0.55 kW (63 - 80)	11N (IE1) - aluminium
0.75 - 9.2 kW (80 - 132)	11P (IE3) - aluminium
11 - 30 kW (160 - 200)	22P (IE3) - cast iron

Structure of the selection tables

1 2										
P_N = 0.12 kW										IE1
50 Hz	60 Hz					at 50 Hz				Dimension sheet see page
0.12 kW	0.14 kW *)									
n₅₀ min ⁻¹	n₆₀ min ⁻¹	M₂ Nm	f_B	i		F_{rN} kN				
3	4	5	6	7		8	9		10	11

- 1** Rated power of the motor
- 2** Given values are based on the respective efficiency class
- 3** Output speed at 50 Hz
- 4** Output speed at 60 Hz
- 5** Output torque
- 6** Service factor
- 7** Total ratio
- 8** Permissible radial load at midpoint of the output shaft extension (standard bearing) at axial load=0
- 9** Geared motor type
- 10** Weight
- 11** Dimension sheet see page

*) Increased rated power at 60 Hz can only be reached together with increased voltage within the wide range (for details see page 254).

Increased rated power
1.2 x P _N

n ₁ =1400 min ⁻¹	8	48.10	110	29	481/10									
		43.50	110	32	87/2									
		39.00	110	36	39/1									
Maximum torque 110 Nm	9	34.27	110	41	377/11									
		30.88	51	45	247/8									
		30.73	110	46	338/11									

- 1** Type of gear unit
- 2** Total ratio
- 3** Permissible output torque at S1 operation ($f_b = 1.0$)
- 4** Output speed (gear unit) at $n_1 = 1400\text{ min}^{-1}$
- 5** Exact mathematical ratio
- 6** Possible motor frame sizes
- 7** Number of gear stages
- 8** Motor speed
- 9** Maximum torque

The modular motor system

Our motor system is an optimised and modularly designed kit. It includes harmonised modules like brakes, encoders, forced ventilation and connecting systems which are combined to the customer's requirements.

The significant advantage of this concept offers fast and reliable delivery times, not only to our local customers but also internationally, because WEG's competent sales network and assembling centres guarantee the availability of components worldwide.

Detailed description of the motor modules see from page 271.

The modular system motor

Due to special windings and clever connecting systems it's possible to use the same motor all over the world. Just a change of connection (4 possible options) and the motor can do its job reliably in Europe, USA or Far East, from 110 V to 690 V, 50 Hz and 60 Hz.

The modular system motor is available in two energy efficiency classes:

IE1: Series 11N, IEC frame sizes 63 to 80 (up to 0.55 kW)

IE3: Series 11P (aluminium), IEC sizes 80 to 132 (0.75 - 9.2 kW) and series 22P (cast iron), IEC sizes 160 and 200 (11-30 kW)

Motors in energy efficiency class IE4 on request

Advantages

- Wide voltage range
- Switchable to all usual voltages worldwide:
 - 110-480 V - 50/60 Hz up to and including frame size 100
 - 190-690 V - 50/60 Hz for frame sizes 112 to 200
- Frequency inverter operation 100/120 Hz
- Ambient temperature -20 to +40 °C
- Nameplate with 50/60 Hz data
- Flexible adjustment of the terminal box
- Reinforced bearings (integral motor)
- Shaft system for immediate assembling of motor modules, like encoders, brakes, back stop, etc.
- Standard degree of protection IP55
- Thermal protection with bimetal switch and/or PTC thermistor
- Thermal class F
- System motor, prepared for flexible assembling of motor modules
- Certified for worldwide distribution: CE, CSA, UL, EAC

The ideal motor for frequency inverter operation

Switchable to 100/120 Hz. Simply switch over and use the double output.

The excellent combination of the modular system motor and variable speed drives by WEG (type CFW for various applications and decentralised motor drive MW500) enables drive systems with wide speed range.

Rated torque up to double rated speed

Two times rated power at double rated speed

WEG20 geared motor with decentralised motor drive MW500

1. Voltage and frequency fluctuations

According to DIN EN 60034-1, a distinction is made between range A and range B (outside A) for voltage and frequency fluctuations. Range A and range B describe the permissible range in which frequency and voltage levels are permitted to deviate from the relevant measurement point (see illustration). The coordinate mean point "0" identifies the measurement point for the frequency and voltage in each case. The motor must be able to issue the rated torque in both ranges A and B.

Range A

In continuous operation in range A, the characteristics are permitted to vary from the rated operation, and the heating at the limits of range A can be around 10 K higher.

Range B

The deviations from the characteristics are permitted to be greater than in range A, the heating levels can be higher than at the measurement point. Duration and frequency of operation in range B should be limited. Corrective measures, e.g. power reduction, should be provided. If a machine has multiple rated voltages or a rated voltage range, the permissible voltage and frequency fluctuations apply for each individual value of the rated voltage.

Ranges A and B according to DIN EN 60034-1

2. Modes of operation

Duty type according to DIN EN 60034-1 and VDE 0530-1.

The duty type is designated by the abbreviations S1 to S10. For the duty types S4, S5 and S7 the duty cycles/hour (c/h) and the factor of inertia F_I should also be stated at the bottom.

The factor of inertia F_I is the ratio of the total load moment of inertia (referred to the motor shaft) and the motor moment of inertia, to the motor moment of inertia, i.e.

$$F_I = \frac{\sum J_{\text{ex,red}} + J_{\text{mot}}}{J_{\text{mot}}}$$

Definition		Example
S1	Continuous running duty with constant load	S1
S2	Short-time duty with constant load Duration of operation under rated conditions (recommended values: 10, 30, 60 or 90 min)	S2 10 min
S3	Intermittent periodic duty. Motor temperature not affected by starting operation Cyclic duration factor (recommended values: 15, 25, 40 or 60 %): Cycle duration (10 min unless otherwise stated)	S3 25 % 60 min
S4	Intermittent periodic duty. Motor temperature affected by starting operation Cyclic duration factor (recommended values: 15, 25, 40 or 60 %): Indication of the duty cycles per hour and of the factor of inertia F_I	S4 40 % 200, $F_I=2$
S5	Intermittent periodic duty. Motor temperature affected by starting operation and electric braking Cyclic duration factor (recommended values: 15, 25, 40 or 60 %): Indication of the duty cycles per hour and of the factor of inertia F_I	S5 15 % 300, $F_I=1$
S6	Continuous operation periodic duty. Cyclic duration factor (recommended values: 15, 25, 40 or 60 %): Cycle duration (10 min unless otherwise stated)	S6 25 % 60 min
S7	Continuous operation with starting and electric braking Indication of the duty cycles per hour and of the factor of inertia F_I	S7 200, $F_I=1$
S8	Continuous operation with related load/speed changes (Sequence of similar cycles) Speeds during the duty cycle Periods for which these speeds are maintained during the duty cycle Indication of the factor of inertia F_I	S8 3000 ^{min-1} , 10 min 1500 ^{min-1} , 15 min $F_I=1.5$
S9	Continuous operation duty with unrelated load/speed changes	S9
S10	Duty with discrete constant loads and speed	S10 $F_I=0.6$

Legend see page 282.

7. Motor protection

The correct selection of protective equipment determines essentially the operation reliability and service life of motors. Current dependent protection and thermal protective devices are available. Fuses do not protect the motor against overloads, they only protect the supply cables or switchboards against short circuits.

8. Overload protection (protection relay)

It is recommended to use starters with thermal overload protection. The overloads should be adjusted to the rated current shown on the nameplate. Thermal protective devices (thermistors in windings) see page 271.

9. Speed and rotation direction

The rated speed is valid for the rated data (voltage, frequency). The synchronous speed depends on the line frequency.

The motors are able for operation in both directions. By connection of U1, V1, W1 to L1, L2, L3 the rotation will be to the right if you look at the shaft from the driveside. Left direction can be easily made by changing of two wires.

10. Cable entry

For all frames, the terminal box can be rotated in 90° increments. Terminal boxes are not delivered with cable glands in standard. Motors are supplied with plastic threaded plugs in the cable entries to maintain the degree of protection during transport and storage. In order to guarantee the degree of protection, cable entries must comply with at least the same degree of protection indicated on the motor nameplate.

Side designation for cable entries

11. Cooling

The motors are totally enclosed fan cooled (TEFC) by means of external surface ventilation (IC411), as per IEC 60034-6). Maximum ambient temperature +40 °C. Please check the minimum distance "Y" (see dimension sheets from page 266) between cover and wall by mounting the motor.

■ Integral fans (TEFC, IC411)

Particular attention has been dedicated to the shape in order to reduce noise and improve the efficiency of the motor. Radial construction has been selected to allow rotation in both directions.

■ Fan cover

In treated steel plate, properly profiled to improve efficiency and reduce the noise produced by the fan.

■ Forced ventilation (TEFV, IC416) see also page 289

For special operating conditions, e.g. increased permissible number of operations per hour or variable speed operation, the motors of IEC sizes 63 to 200 can be supplied with forced ventilation by means of a separately fitted fan motor.

12. Insulation

The motors in this catalogue comply with the requirements of thermal class F. All windings are impregnated with varnish with a high mechanical strength. The maximum temperature of the insulation is, according to thermal class F, at +155 °C. The motors are utilised at rated values according to thermal class B (+130 °C). Copper wire insulation and the impregnation varnish have a temperature index class F and therefore there is a large margin of safety in addition to high overload capacity.

Motors from frame size 160 are equipped with the WISE® insulation system of the new W22 motor range by WEG.

13. Noise levels

Noise measurements were taken in accordance with standard IEC 60034-9 (see table to the right).

14. Balancing of rotors

Motors comply with vibration strength level "A" according to standard IEC 60034-14. On request, motors may also be balanced according to level "B".

15. Shaft ends

Shaft ends of motors in frame sizes 63 up to 132 are equipped with a conical bore and do not have a key, while the frame sizes 160 to 200 have a shaft with closed end keyway. On the non-driven side, modular motors have a system shaft to mount motor modules, such as brakes, encoders, back stops, etc.

16. Voltage, current and frequency

In standard execution the motors are delivered with following rated voltages: see Chapter 17 Electrical connection (basic connection).

Special voltages

Motors for special voltages and/or frequencies are available on request.

Speed and connection

Tolerance of the motor speed according to IEC 60034. Terminal board connection see page 255.

Connection

■ Direct connection

The starting torque in direct connection amounts to 160 to 330 % of the rated torque, depending on power and number of poles. The starting current is about 2.5 to 8 times of the rated current.

■ Star-delta starting

The star-delta (Y-D) starting is an easy way to reduce the starting current and starting torque. Motors can be started with this starting method whenever the supply voltage corresponds to the rated voltage of the motors in delta connections. Up from frame size 112 the standard modular motors are supplied with windings designed for this starting method (e.g. 400 V D / 690 V Y). A Y-D-starting is only possible with delta service connection (this shall be considered when selecting a motor!), as the motor is first Y-connected and is changed over to D-connection after the run-up phase. At Y-D-starting, the starting currents and torques will be reduced to about 1/3 of the values produced in case of direct-online starting. Attention should be paid to the fact that a current impulse is produced when changing over to D-connection.

17. Electrical connection

Rated voltages for motor series 11N, 11P (IEC frame sizes 63 to 100)					
Possible connection		Rated power P_N	Increased rated power $1,2 \times P_N$	Frequency inverter operation	
	Delta	220 - 230 - 240 V at 50 Hz 220 - 265 - 277 V at 60 Hz	- 254 - 265 - 277 V at 60 Hz		400 V, 87 Hz
	Delta - Delta	110 - 115 - 120 V at 50 Hz 110 - 132 - 138 V at 60 Hz	- 127 - 132 - 138 V at 60 Hz		230 V, 100 Hz

	Star - Star	190 - 200 - 210 V at 50 Hz 190 - 230 - 240 V at 60 Hz	- 220 - 230 - 240 V at 60 Hz		460 V, 120 Hz

Rated voltages for motor series 11P and 22P (IEC frame sizes 112 to 200)					
Possible connection		Rated power P_N	Increased rated power $1,2 \times P_N$	Frequency inverter operation	
	Delta (basic connection)	380 - 400 - 420 V at 50 Hz 380 - 460 - 480 V at 60 Hz	- 440 - 460 - 480 V at 60 Hz		400 V, 100 Hz
	Delta - Delta	190 - 200 - 210 V at 50 Hz 190 - 230 - 240 V at 60 Hz	- 220 - 230 - 240 V at 60 Hz		
	Star	660 - 690 - (730) V at 50 Hz 660 - (796) - (830) V at 60 Hz	- (760) - (796) V at 60 Hz		460 V, 120 Hz
	Star - Star	330 - 346 - 365 V at 50 Hz 330 - 400 - 415 V at 60 Hz	- 380 - 400 - 415 V at 60 Hz		

Terminal board connection

18. Variable speed drive application

The stator windings of the motors are wound with class F insulation (class H optional) and are suitable for either DOL starting or - regarding the limits shown in the tabel below - via a variable speed drive.

Rated voltage				
220-240/380-415 V (50 Hz) 400-460 V (60 Hz)				
Motor rated voltage	Voltage spikes	dV/dt *	Rise time *	Time between pulses
	At motor terminals (phase-phase)	At motor terminals (phase-phase)		
$V_{rated} < 460 \text{ V}$	$\leq 1600 \text{ V}$	$\leq 5200 \text{ V}/\mu\text{s}$	$\geq 0.1 \mu\text{s}$	$\geq 6 \mu\text{s}$
$460 \text{ V} \leq V_{rated} < 575 \text{ V}$	$\leq 2000 \text{ V}$	$\leq 6500 \text{ V}/\mu\text{s}$		
$575 \text{ V} \leq V_{rated} \leq 1000 \text{ V}$	$\leq 2400 \text{ V}$	$\leq 7800 \text{ V}/\mu\text{s}$		

* dV/dt and rise time definition according to NEMA MG1 - part 30

Notes:

- In order to protect the motor insulation system, the maximum recommended switching frequency is 5 kHz.
- If one or more of the above conditions is not attended, a filter (load reactor or dV/dt filter) must be installed in the output of the VSD.
- General purpose motors with rated voltage greater than 575 V, which at the time of purchase did not have any indication of operation with VSD, are able to withstand the electrical limits set in the table above for rated voltage up to 575 V. If such conditions are not fully satisfied, output filters must be used.
- General purpose motors of the dual voltage type, for example 400/690 V or 380/660 V, which at the time of purchase did not have any indication of operation with VSD, are able to be driven by a VSD in the higher voltage only if the limits set in the table above for rated voltage up to 460 V are fully attended in the application. Otherwise, a load reactor or a dV/dt filter must be installed in the VSD output.

Electrical basic data

Notes for electrical basic data

The technical data according to selection tables (starting current, torques, power factor, etc.) are valid for the rated values, that means for the rated voltage and rated frequency.

If the motors are running on higher or lower voltage within the wide range voltage, the stator winding will be utilised according to thermal class F. In these cases a power increase in accordance to a. and b. on page 252 is not possible.

The design of the wide range winding permits supply voltage deviations in the indicated wide range voltage of $\pm 5\%$ without reduction of the power.

																	[kg]

- 1 P_N = Rated power
- 2 n_N = Rated speed
- 3 I_N = Rated current
- 4 I_A/I_N = Ratio of starting current to rated current
- 5 IE class = Efficiency class
- 6 η 4/4 (3/4, 1/2) = Efficiency at rated power
- 7 $\cos\varphi$ = Power factor
- 8 M_N = Rated torque
- 9 M_A/M_N = Ratio of starting torque to rated torque
- 10 M_K/M_N = Ratio of sweeping torque to rated torque
- 11 J_{mot} = Motor moment of inertia
- 12 m = Weight of the motor
- 13 M_B = Braking torque
- 14 J_B = Brake moment of inertia
- 15 m = Weight of the motor brake

Temperature control

TH	Bimetal switch for switch off
2TH	Bimetal switch for warning and switch off
TF	PTC thermistor for switch off
2TF	PTC thermistor for warning and switch off
KTY	Temperature sensor

In the standard version, the motors are designed with motor protection in the motor winding. In order to protect the winding of a three-phase induction motor against thermal overloads, resulting for example from overloading and operation with only two phases, one of the following devices can be provided:

TH - Bimetal switch „NC contact“

The contact is normally closed (NC); the disc opens when the winding's temperature reaches limits dangerous for the insulation system. When a limit temperature is reached, these bimetal switches (NC contacts) can deactivate an auxiliary circuit. The circuit can only be reclosed following a considerable fall in temperature. When the motor current rises quickly (e.g. with a locked rotor), these switches are not suitable due to their large thermal time constants.

TF - PTC thermistor

The most comprehensive protection against thermal overloading caused in starting against heavy masses, heavy alternating load and high frequency starting resp. brake operation or high ambient temperatures of the motor is provided by PTC thermistors installed in the motor winding.

The sensors are temperature sensitive resistors (PTC) which change value almost instantaneously at their response temperature. The switch off level corresponds to the thermal class of the insulation. This characteristic is used in combination with tripping devices (on request) to monitor the temperature of the motor. For warning purposes additional bimetal switches or PTC thermistors with lower switch off temperature can be fitted. These correspond to the key **2TH** and **2TF**.

KTY - Temperature sensor

This sensor is a semiconductor that changes its resistance depending on temperature in accordance with a defined characteristic. The evaluation is made by an extra tripping device (on request). The temperature sensor is embedded in the winding head of the motor in the same manner as a PTC thermistor. Evaluation is performed, for example, in the frequency inverter.

Anti-condensation heating

SH	Anti-condensation heating
-----------	---------------------------

Windings of motors, which are operating at conditions of extreme temperature changes or extreme climatic conditions, are endangered of condensation water. The built in anti-condensation heating warms up the motor windings after switching off and prevents the motor inside from condensation water.

During motor operation the anti-condensation heating must not be switched on. The limit temperature of the winding (+155°C in thermal class F) must not be exceeded! Temperature control is advisable!

The anti-condensation heating must be supplied with a separate voltage.
Supply voltage: 230 V (1~)

Voltage range for IEC frame sizes: 71 to 200: 220 - 240 V, 50/60 Hz

IEC frame size	Heating performance [W]
71	13
80	25
90	
100	
112	50
132	
160	75
180	
200	100

Climatic protection

K1	Humidity protection
K2	Corrosion protection

The following standardised climatic protection executions are available for motors exposed to extreme climatic conditions:

K1 - Humidity protection

Humid warm climate or humid variable climate with max. relative air humidity of 92 %, also for areas on the seaside

K2 - Corrosion protection

Relative air humidity of more than 92 % (extreme formation of condensation water), furthermore against chemically aggressive gases and vapours of increased concentration

Drain

KB	Drain
-----------	-------

In cases of increased air humidity, periodic duty, installation in the open air or when subject to extreme climatic conditions, the motors are endangered by the formation of condensation. The endshields have holes for drainage of water that may condense inside the frame. These holes are supplied with rubber drain plugs, which leave the factory in closed position and must be opened periodically to allow the exit of condensed water.

To determine the correct position of the hole the exact mounting position of the motor must be defined.

M

Terminal box designs

MIP	Multipin box
MIG..	MIG - connect systems

MIP - Multipin box

IEC frame sizes: 63 to 200

This extended terminal box was designed to permit additional options, such as brakes, incremental encoders, thermal elements, anti-condensation heating and the like, to be connected in an orderly fashion in the box.

The terminal box can be equipped with up to 22 sockets, including a brake rectifier. The terminal used are two-wire terminals fitted with cage clamp connectors. These are suitable for single-wire, multi-wire and fine-wire lines with diameters up to 4 mm².

MIG - connect system

Models: MIG10B, MIG16, MIG40, MIG10-FL

IEC frame sizes: 63 to 180

The MIG (Multiplug) - connect system is a standardised distributed connection system. It is used for the integration of power and control cabling into a single motor connector. The plug is assembled in-house and replaces the terminal box.

Most important advantages:

- Quick installation and service at site
- Avoiding wiring faults
- Motor replacement without electrical manipulation

For motor frame sizes 63 to 180 three MIG types of different power ratings are used. For each MIG model mating connectors are available.

MIG10B:

With 18 PINs and ground this most compact plug enables connection to motors up to a rated current of 10 A with voltages up to 400/690 V and protection degrees up to IP67. Beside the power wires a variety of auxiliary wires can be connected as well.

MIG16:

This MIG for mid-sized motors supports a maximum current of 16 A at 500 V with 10 PINs in total. In case a wider variety of auxiliary PINs is necessary a mixed holding can be offered (6 PINs - 16 A; 12 PINs - auxiliary).

MIG40:

To achieve all contacts to be connected with one plug a mixed holding of PINs has to be used in this case. 6 PINs for 40 A at 400/690 V together with 12 PINs auxiliary guarantees full contactability.

MIG10-FL:

On demand this MIG can replace the normal forced ventilation connection. Thereby this motor module has all advantages of a MIG - connect plug system. The plug is equipped with 3 PINs and grounding and can be mounted on every forced ventilation size.

MIG40 execution

Brake system and Back stop

BR..	Spring loaded brake
BBRHGD..	Double spring loaded brake
BRGH..	Totally closed spring loaded brake (Heavy Duty)
KKM	Back stop (frame sizes 63 to 90)
RSM	Back stop (frame sizes 100 to 200)

The mounted spring loaded brake is a single-disc brake with two friction surfaces. It is released electromagnetically and brakes by spring pressure, when the brake is de-energised. The DC-brake coil is supplied from a rectifier which is located in the motor terminal box and will be delivered as standard for AC-side connection.

Product information

- Voltages: 24 V DC and 195 V DC (102 V DC special execution)
- All bare parts corrosion protected
- Short switching times
- Large reserve for abrasion
- Designed for 100 % duty cycle and max. admissible temperature limit of +145 °C
- Degree of protection IP55 (standard)

a air gap
b brake lining thickness

On motors with brake-endshield on the non-driven side subsequent installation of brakes is possible (brake-motor-set available).

Function and adjustment (see illustration below)

When the brake is de-energised, the springs are pressing the armature disc (9) against the brake disc (7) and the friction plate (5). The motor shaft (3) is braked via the brake disc (7) and the gear hub (6). When the brake is energised, a magnetic field is built up and the armature disc (9) is pulled against the magnetic case with the coil (10). When the motor is running, the brake disc (7) can rotate freely from the brake surfaces. In the case of power failure, the brake functions automatically by spring force. A manual release (11) is optionally available (subsequent assembling is also possible).

Braking torque adjustment

At delivering, the brakes and the brake motors are adjusted to the brake torque M_B . Brake torque reduction is done by removing of springs. Reduced brake torque see page 277.

Maintenance

Due to abrasion of the friction linings (7) the air gap "a" (see page 275) between magnetic case (10) and armature disc (9) expands. It is necessary to check and readjust the air gap in certain intervals or replace the brake disc (7).

Readjustment of the air gap

First of all the three fixing screws (13) must be loosened half a turn. Now the sleeve screws (8) can be screwed into the magnetic case (10) by turning counter-clockwise. By turning the three fixing screws (13) clockwise, the magnetic case (10) can be moved in direction to the armature disc (9), as long as the nominal air gap a_{normal} (see table on page 278) is obtained. Now the three sleeve screws (8) will be unscrewed clockwise from the magnetic case (10) and the fixing screws (13) will be fixed. Please check the air gap "a" with a feeler gauge, if it is symmetrical and adjust it if necessary.

Brake selection

As shown in the following selection table, it is possible to supply brake motors with different brake torques to correspond to the most possible applications. It is also possible to achieve an optimal adaption, by means of the mode of connection of the brake. If exact values about the application are available, we recommend to calculate the braking torque according to the following formulas on page 282, otherwise the proportion between motor rated torque (M_N) and braking torque (M_B) can be taken as an indication for the dimensioning of the brake and check, if the safety factor is sufficient.

For normal applications we recommend sizing the brake 1.5 - 2 times the motor rated torque (M_N), for special applications (lifting gears, switching operation, etc.) 2 - 3 times the motor torque and as holding brake approx. 1 time the rated torque.

■ Execution A - working brake

M_B approx. 1.5 - 2 times M_N , or applications with medium masses to be accelerated and medium number of starts

■ Execution B - holding brake

M_B approx. 1 time M_N for drives with small masses to be accelerated and number of starts resp. for keeping the drive stopped

BR.. - Spring loaded brake

Degree of protection IP55. The braking torque is adjustable with reduction of the springs (see page 277).

BR.. Spring loaded brake without additional options

Possible options:

- BRH..** With manual release
- BRHA..** With manual release and locking device
- BRR..** With corrosion protection IP55
- BRS..** With dust protection IP65
- BRSR..** With dust and corrosion protection IP65
- BRGD..** Low noise execution

Ordering examples:

- BR5** Brake 5 Nm
- BRHASRGD40** Brake 40 Nm with manual release, locking device, dust and corrosion protection and low noise execution

BRM - Micro switch

When brake release monitoring is necessary, a micro switch (5) can be fitted to indicate brake release. This signal can be used to start the electric motor. When air gap "a" (see page 275) is at its maximum and the armature is no longer attracted to the magnet body the motor will not start and air gap "a" must be adjusted.

The installation of the micro switch is possible for brakes > 5 Nm.

BRH.. - Manual release

The installation of the manual release is possible for brakes > 5 Nm. The manual release (1) is necessary for manually releasing the brake in cases of power failure. Brakes will be supplied with manual releases fitted by factory. The adjustment of the manual release may not be changed, not even when air gap "a" (see page 275) is readjusted, as safety can be adversely affected.

BRHA.. - Manual release with locking device

In case of service the manual release can be fastened with a locking device. Take care that in rated condition the brake is released (see illustration on page 280). The 0° position of the manual release with locking device is **only possible** with motor frame sizes 100, 160, 180 and 200.

BRR.. - Corrosion protection

Protection class IP55. Consists of painted brake endshield and friction plate (3), which is made of non-corrosive material.

BRS.. - Dust protection

Protection class IP65. Consists of friction plate (3), which is made of non-corrosive material, dust protection ring (2) and shaft seal.

BRSR.. - Corrosion and dust protection

Protection class IP65. Consists of painted brake endshield, friction plate (3), which is made of a non-corrosive material, dust protection ring (2) and shaft seal.

BRGD.. - Low noise execution

To reduce the switching noises of the spring loaded brake, the o-ring (4) can be inserted between armature plate and brake body.

Manual release with locking device (from brake size 5 Nm)

Possible positions of the manual release at the view of the motor fan cover. (The 0° position of the manual release with locking device is only possible with motor frame sizes 100 and from 160.)

BBRHGD.. - Double spring loaded brake

Double brakes (from motor frame size 71) are two specially designed low noise brakes working independently of each other meeting high demands on safety.

As option a micro switch (5) is monitoring the function of the brakes. The brakes are executed per default in low noise execution and with manual release. Braking torque is adjustable with reduction of the springs (see page 277).

BBRHGD.. Double brake in low noise execution with manual release (standard)

Possible options:

BBRHSGD.. With dust protection IP65
BBRGD.. Without manual release

Ordering examples:

BBRHGD6 Double brake 2 x 6 Nm in low noise execution with manual release
BBRHSGD187 Double brake 2 x 187 Nm in low noise exec. with man. release and dust protection

BBRM - Micro switch

When brake release monitoring is necessary, a micro switch (5) can be fitted to indicate brake release. This signal can be used to start the electric motor. When air gap "a" (see page 275) is at its maximum and the armature is no longer attracted to the magnet body the motor will not start and air gap "a" must be re-adjusted.

BBRHSGD.. - Dust protection

Protection class IP65. Consists of friction plate (3), which is made of non-corrosive material, dust protection ring (2) and shaft seal.

BBRHGD.. - Manual release

The manual release (1) for manually releasing of the brake in cases of power failure. Brakes will be supplied in standard with manual release fitted by factory. The adjustment of the manual release may not be changed, not even when air gap "a" (see page 275) is readjusted, as security can be adversely affected.

Possible positions of the manual release see on page 280.

1 Manual release
 2 Dust protection ring
 3 Friction plate

4 O-ring
 5 Micro switch (optional)

Calculation of the brake torque

If the mass moment of inertia, the rotation speed and the permissible braking time of the machine are known, the torque of the spring loaded brake can be calculated.

	Formula	Unit
Load moment (static load)	$M_L = F \cdot r$	[Nm]
Braking torque (dynamic load) There is a pure dynamic load if fly-wheels, rolls, etc. have to be slowed down and when the static load is very insignificant.	$M_a = 1,046 \cdot 10^2 \cdot J_{ZUS} \cdot \frac{n}{t - t_1}$ $M_{aerf} = M_a \cdot K \leq M_B$	[Nm]
Braking torque (dynamic and static load) In most applications there is also dynamic load in addition to static load.	$M_{aerf} = (M_a \pm M_L) \cdot K$ $M_{aerf} = (1,046 \cdot 10^2 \cdot J_{ZUS} \cdot \frac{n}{t_b} \pm M_L) \cdot K$ $M_{aerf} \leq M_B$	[Nm]
Estimated determination of braking torque	$M_{aerf} = 9,55 \cdot 10^3 \cdot \frac{P}{n} \cdot K$ $M_{aerf} \leq M_B$	[Nm]
Deceleration time	$t = t_B + t_1$	[ms]
Acceleration time	$t_A = \frac{J_{ges} \cdot n_1}{9,55 \cdot (M_A \pm M_L)} + t_2$ $J_{ges} = J_E + J_{ZUS}$	[s] [kgm ²]
Braking time	$t_B = \frac{J_{ges} \cdot n_1}{9,55 \cdot (M_A \pm M_L)}$ $J_{ges} = J_E + J_{ZUS}$	[s] [kgm ²]
The conversion of several mass moments of inertia with different rotation speeds in a mass moment of inertia reduced to the motor shaft	$J_{ZUS} = \frac{J_2 \cdot n_2^2 + J_3 \cdot n_3^2 \dots}{n_1^2}$	[kgm ²]
Conversion of straight-line moved machine parts into a corresponding J on the motor shaft	$J = 91,2 \cdot m \cdot \frac{v^2}{n_1^2}$	[kgm ²]
Friction per switch cycle	$W_R = \frac{J_{ZUS} \cdot n^2}{182,5} \cdot \frac{M_B}{M_B \pm M_L}$ $W_R < W_{Rmax}$	[J]
Friction performance	$P_R = W_R \cdot S$ $P_R < P_{Rmax}$	[J/s]

Designation	Unit	Description
M_L	[Nm]	Load moment Sign + : when the load moment acts decelerating (lifts when going up) Sign - : when the load moment acts accelerating (lifts when going down)
M_{aerf}	[Nm]	Necessary braking torque
M_a	[Nm]	Braking torque
M_A	[Nm]	Starting torque of motor
M_B	[Nm]	Rated torque of spring loaded brake
K	-	Safety factor according to the operating conditions (1...3)
F	[N]	Force
F_I	-	Factor of inertia
r	[m]	Lever arm
m	[kg]	Mass of moved machine parts
J, J ₁ , J ₂	[kgm ²]	Mass moment of inertia
J _E	[kgm ²]	Proper mass moment of inertia
J _{ges}	[kgm ²]	Total mass moment of inertia
J _{mot}	[kgm ²]	Mass moment of inertia of the motor

Designation	Unit	Description
J _{ZUS}	[kgm ²]	Additional mass moment of inertia
K	-	Safety factor K ≥ 2
P	[kW]	Power
P _R	[J/s]	Friction performance
P _{Rmax}	[J/s]	Maximum friction performance
n	[min ⁻¹]	Rotation speed
n ₁	[min ⁻¹]	Rotation speed of motor
n ₂ , n ₃	[min ⁻¹]	Rotation speeds
t	[ms]	Deceleration time
t _A	[s]	Acceleration time
t _B	[s]	Braking time
t ₁	[ms]	Engaging time
t ₂	[ms]	Release time of brake
v	[m/s]	Speed
W _R	[J]	Friction work per switch cycle
W _{Rmax}	[J]	Permissible friction per switch cycle
S	[s ⁻¹]	Number of switch cycle per second

Rectifier

Power supply

The DC-brake coil is normally supplied by a half wave rectifier incorporated in the motor terminal box and is also available for coil voltages 162-236 V DC, 85-133 V DC or 24 V DC (24 V with block terminal for external power supply!) Corresponding rectifiers and coil voltages are optionally available for all special voltages. The rectifiers are equipped with varistors to protect them against over-voltages.

At number of starts more than 1/s, please contact us for rectifier loading capacity.

Switching modes

By default brake motors will be delivered with connected rectifier for AC-side switching. For DC-side switching the bridge between terminals 5 and 6 must be removed and a switching contact must be connected. Start-up of motor only with connecting brake.

- **AC-side switching** is executed before the rectifier on AC-side. Here the magnetic field is de-energised slowly, the brake interrupts softly with delay. (Release time $t_1 \approx$)
- **DC-side switching** is executed between rectifier and coil. Thereby an extremely low degree of overrunning is achieved. For all gear units, which require exact braking, especially for lifting gears, a DC-side switching of the brake is absolutely required. (Release time $t_1 =$)

	Designation	Unit
Braking torque	M_B	[Nm]
Voltage	U	[V DC]
Engaging time	t_1	[ms]
Response delay (time from switching power off until braking torque increases)	t_{11}	[ms]
Release time (time from switching power on until braking torque begins to decrease)	t_2	[ms]

Rectifier selection

- *Half-wave and bridge rectifier*

The half wave rectifier which halves the supply voltage is the most cost effective. The bridge rectifier produces 90 % DC voltage from the AC supply voltage. Both rectifiers are available for switching on AC or DC side. Varistors in the input and output protect the rectifiers against surge voltages.

Half-wave rectifier: $U_{2\sim} = 0.45 \times U_{1\sim}$ $I_{\max} = 1 \text{ A}$

Bridge rectifier: $U_{2\sim} = 0.9 \times U_{1\sim}$ $I_{\max} = 2 \text{ A}$

- *Fast excitation rectifier*

For motor frame sizes 63-132 this rectifier can't be installed in the standard terminal box.

The high-speed rectifier uses special connections to make different direct voltages available on the terminals. This means that the following brake operating modes can be selected:

1. Rapid response: Brake voltage level equal to the holding voltage of the fast excitation rectifier: The ventilation time of the brake is reduced.
2. Power reduction: Brake voltage level equal to overexcitation voltage of the fast excitation rectifier: reduced performance losses in the brake coil, engage time of the brake is reduced.

Max. connection voltage: $U_{1\sim} = 500 \text{ V AC}$
 Max. permissible connections: 600 connections/h
 Max. permissible switching capacity: 210 W

Rectifier type	System	U_N [V]	I_N [A]
FBGR-E500/220-GS	Half-wave rectifier	500	1
FBGR-B400/345-GS	Bridge rectifier	400	2
FBGR-S500/220-GS480	Fast excitation rectifier	500	2

Overexcitation phase (voltage)	$T = 0 - 500 \text{ ms } (\pm 200 \text{ ms})$	$U_{2\sim} = 0.9 \times U_{1\sim}$	$I_N = 4 \text{ A}$
Holding phase (voltage)	$T > 500 \text{ ms}$	$U_{2\sim} = 0.45 \times U_{1\sim}$	$I_N = 2 \text{ A}$

Switching diagram for braking motor (star-delta connection)

Back stop

Installing a back stop guarantees that the motor

- can start only in one direction
- can't be turned in wrong direction from counteract torques

KKM Back stop (IEC frame size 63 to 90)

RSM Back stop (IEC frame size 100 to 200)

The applied free wheels of the clamping bodies are mounted on the motor endshield (NDE) in such a manner, that the standard motor dimension LB up to motor size 90 will not be lengthened. From motor size 100 the motor dimension LB1 is valid.

The back stop has been largely dimensioned and corresponds approx. to the motor starting torque (M_A) to prevent a damage in case of short-time-starting against the back stop at switchings made by error. Nevertheless, the free direction of rotation must be determined first, especially at big motor powers and we recommend for the first starting the star connection and only then the delta connection at correct rotation.

Fields of application:

- Drives for elevators and inclined lifts
- Pumps and fans with backpressure ratchet
- Gearmotors for conveyors with non-reverse characteristic

KKM - Back stop (ball bearing free-wheelings)

The elements have bearing characteristics and are used instead of the bearing on the fan side. The outer dimensions are identical to the deep-groove ball bearings.

▪ Function

Rolling elements and spring loaded clamping bodies are built in between inner and outer ring. The rolling elements and ratchet elements are fixed in a plastic cage. Torque transmitting is made by tight fits on the inner and outer ring. The elements are grease prelubricated. They are maintenance-free for 10,000 to 20,000 hours under normal working conditions.

▪ Mounting

The KKM back stop will be mounted instead of the bearing on the non-driven side.

RSM - Back stop (with centrifugal mechanism)

Because the mounted back stops have no bearing properties, they are mounted directly near the non-drive bearing. Above the lifting speed the centrifugal elements are working contactless and so they are maintenance free under normal conditions.

▪ Mounting

The centrifugal elements are mounted directly near the non-driven side bearing between bearing and fan under the fan cover. The inner ring of the back stop is connected with the shaft with a key DIN 6885-1.

▪ Direction of rotation

The direction of rotation has to be given with the ordering.

▪ Back stop direction

Back stop direction at a view on output shaft right or left.
By turning the entire back stop system by 180°, the back stop direction can be reversed (applies only for RSM!).

Back stop overview

IEC frame size	Back stop type	Torque [Nm]	Motor length dimension (see page 266)
63	KKM	7.4	LB
71	KKM	13.5	LB
80	KKM	40	LB
90	KKM	68	LB
100	RSM	150	LB1
112	RSM	150	LB1
132	RSM	390	LB1
160	RSM	580	LB1
180	RSM	580	LB1
200	RSM	1050	LB1

Encoder systems

- I.** Encoder outside the fan cover (IEC frame sizes 63 to 200)
- S.** Encoder inside the fan cover (IEC frame sizes 71 to 200)

Possible versions:

Encoder outside the fan cover

IG	Standard encoder
IC	SINCOS encoder
IR	Resolver
IS	SSI multiturn encoder
IV	Heavy Duty encoder
IA	Special encoder

Encoder inside the fan cover

SG	Standard encoder
SC	SINCOS encoder
SR	Resolver
SS	SSI multiturn encoder
SV	Heavy Duty encoder
SA	Special encoder

Encoder outside the fan cover

Standard position connector (M23)

Encoder inside the fan cover

Modular design

We are using encoders with hollow shaft ($\varnothing$ 12 mm) open at one end. The modular motor shafts are fit to attach an encoder set. The mounting of encoders therefore is easy and immediately possible. Add-on kits are easy to retrofit.

Mounting of encoders

The encoders are equipped with an integral bearing and connected directly on the non-driven motor shaft side. During angular acceleration of the shaft the stator coupling must absorb only the torque resulting from friction in the bearing.

IG, SG - Standard encoder

Type: Kübler Sendix 5020

Pulses per revolution: 1024

Output signal: HTL or TTL

Voltage supply: 10-30 V at HTL, 5 V at TTL

Degree of protection: IP66

IG standard: with PIN connector (M23) on the encoder

SG standard: with PIN connector (M23) on the terminal box (mating connector not included in delivery)

Other numbers of pulses per revolution on request.

IC, SC - SINCOS encoder

Pulses per revolution: 1024

Output signal: Sinus 1VSS

Voltage supply: 10-30 V or 5 V

IC standard: with PIN connector (M23) on the encoder

SC standard: with PIN connector (M23) on the terminal box (mating connector not included in delivery)

Other numbers of pulses per revolution on request.

Encoders in standard mechanical designs can also be implemented as electric SINCOS versions. In this case, signals A and B are available on the output as sinusoidal voltage signals with a signal level of 1 VSS or one 0 pulse once per rotation. These can be used in many different ways in the downstream electronics. Via interpolation of the two signals shifted by 90° , very high resolutions are achieved and can therefore also be used with very slow movements for speed control.

IR, SR - Resolver

Degree of protection: IP54 (IP66 on request)
 IR standard: with 0.6 m cable (open one way, 6 strands)
 SR standard: with 0.6 m cable (open one way, 6 strands)

Resolvers are primarily 2-pole, electromagnetic measuring transducers for converting the angle position of a rotor into an electrical value. Resolvers are wear-free and robust, as the most important elements for acquiring the information consist only of iron core and copper coils. Contamination therefore plays a lesser role.

The configuration consists of 2 stator coils positioned at an offset of 90° (S1/S3 and S2/S4) and a rotating rotor coil (R1/R2). In this process, the rotor coil supply is inductive, in other words, brushless.

The R1/R2 rotor coil is excited using a sinusoidal alternating voltage. The amplitudes of the voltages induced in stator coils S1/S3 and S2/S4 depend on the rotor angle.

Input voltage: $E_{(R1/R2)} = E \times \sin(\omega t)$

Output: $E_{(S1/S3)} = T_r \times E_{(R1/R2)} \times \cos(\varphi)$
 $E_{(S2/S4)} = T_r \times E_{(R1/R2)} \times \sin(\varphi)$

Standard input voltage: $E_{(R1/R2)} = 7 \text{ V}$
 Standard transformation ratio: $T_r = 0.5$

IS, SS - SSI multi turn encoder

Digits per revolution: 8192 at 4096 possible rotations
 Output signal: TTL
 Voltage supply: 5 V
 Degree of protection: IP66
 SS standard execution: with PIN connector on the terminal box

The SSI multiturn absolute encoder signals a single exactly defined position to the drive frequency controller. Maximum permissible number of motor revolutions can be 4096. The resolution is 8192 steps per revolution. The serial communication is corresponding to the specification of the SSI-protocol. SSI means Synchronous Serial Interface.

The permissible cable length is 100 m at least if EMC-compatible wiring is guaranteed.

IV, SV - Heavy Duty encoder

Possible for IEC frame sizes 90 to 200
 Pulses per revolution: 1024
 Output signal: HTL or TTL
 Voltage supply: 10 - 30 V at HTL, 5 V at TTL
 Degree of protection: IP65
 Optional insulation inserts available to protect against shaft currents.

The Heavy Duty encoder boasts a high degree of ruggedness in a very compact design. Its special construction makes it perfect for all applications in very harsh environments.

IA, SA - Special encoder

The mounting of special encoders is possible on request.

Type of signal

■ HTL-/TTL - output signal

Encoders with HTL/TTL square-wave output signals incorporate a circuit that digitises scanning signals, providing two 90° (el.) phase-shifted HTL-/TTL square-wave pulse trains U_{a1} and U_{a2} and a reference pulse U_{a0} , which is gated with the incremental signals U_{a1} and U_{a2} . The integrated electronics also generate the inverse signals of all square-wave pulse trains. The distance between two successive edges of the combined pulse trains U_{a1} and U_{a2} is one measuring step. HTL/TTL square-wave signals can be transmitted to the subsequent electronics (without inverting: max. cable length 100 m; with inverting: 250 m), provided that the specified $5 \text{ V} \pm 5 \%$ supply voltage is maintained at the encoder. Extended cable length is possible with fiber-optic cable.

■ 1VPP - output signals

The sinusoidal incremental signals U_{a1} and U_{a2} are phase-shifted by 90° and have signal levels of approximately 1VPP. The signal peaks from the reference mark signal have a usable component of approximately 0.5 V. Signal interpolation and digitalisation can be performed by electronics, which output TTL-compatible signals.

Voltage signals can be transmitted to the subsequent electronics unit over cables as long as 50 m, provided that the specified $5\text{ V} \pm 5\%$ supply voltage is maintained at the encoder. Encoders that produce voltage signals have sensor line connections for detection of the supply voltage at the encoder; corresponding control systems in the subsequent electronics can then maintain the voltage tolerance.

HTL/TTL

1VSS

HTL signal levels

$U_H \geq 2.1\text{ V}$ at $I_H = 20\text{ mA}$
 $U_L \leq 2.8\text{ V}$ at $I_L = 20\text{ mA}$
 with power supply +24 V, without cable

TTL signal levels

$U_H \geq 2.5\text{ V}$ at $I_H = 20\text{ mA}$
 $U_L \leq 0.5\text{ V}$ at $I_L = 20\text{ mA}$

	Designation
Encoder signals	U_{a1}, U_{a2}
Reference pulse	U_{a0}
Signal level HIGH	U_H
Signal level LOW	U_L
Edge separation	a
Phase shift	P
Current at signal level HIGH	I_H
Current at signal level LOW	I_L
Signal period	SP
Delay time	t_d

Ventilation systems

FL	Forced ventilation
ZL	Fly wheel fan
ZM	Metal fan
U	Non-ventilated without NDE shaft end
UW	Non-ventilated with NDE shaft end

FL - Forced ventilation (TEFV, IC416)

IEC frame sizes: 63 to 200

At applications with high starting frequencies, startings against heavy masses, heavy alternating load and operations with frequency inverters, self ventilation of the motor sometimes will not be sufficient and forced ventilation is necessary. At frequencies under 30 Hz forced ventilation is recommended in order not to thermally overstrain the motor.

Forced ventilation currents (2 pole ventilation motor)

ZL - Fly wheel fan

IEC frame sizes: 71 to 132 (special execution)

Fly wheel fans increase the inertial moment of the standard motors by a multiple and help to decrease the start up time of the motors. Motors with fly wheel fan often are used at crane drives or machine-systems where a soft start up is required. Available for motor sizes 71 to 132 on request, exchangeable without modification with standard fan, pay attention to the reduced starting frequency! Braking by reversal and driving up against a buffer stop is not permissible.

Motor without brake: $J_{ges} = J_{mot} + J_{ZL}$

Brake motor: $J_{ges} = J_{mot} + J_{ZL} + J_B$

	Designation	Unit
Total mass moment of inertia	J_{ges}	[kgm ²]
Mass moment of motor	J_{mot}	[kgm ²]
Mass moment of brake	J_B	[kgm ²]
Mass moment of fly wheel fan	J_{ZL}	[kgm ²]
Weight of fly wheel fan	m	[kg]

IEC frame size	J_{ZL} [kgm ²] x 10 ⁻³	m [kg]
71	2	1.3
80	2	1.3
90	3	1.6
100	10	3.3
112	10	3.3
132	14	3.8

ZM - Metal fan

Possible from frame size 71 as option

For ambient temperatures which are lesser than or greater than the operation temperatures of the standard plastic fan wheels, the ventilation can be provided via metal fan wheels. These can be manufactured from aluminium, steel plate or cast iron. Using a metal fan can be appropriate in the event of difficult climatic conditions.

U - Non-ventilated without NDE shaft end (TENV)

IEC frame size: 63 to 200

In this version, there is no fan or fan cover. The NDE is completely enclosed. A cover plate is used as the sealing component. This prevents dirt, water, etc. from entering the motor.

UW - Non-ventilated with NDE shaft end (TENV)

IEC frame size: 63 to 200

This design is realised by omitting the fan. The standard fan cover is used as contact protection for the remaining NDE rotating shaft. Motors of these designs are intended for use in systems where fans or fan covers integrated into the motor are not appropriate due to the environmental conditions, for design reasons or at the customer's request. The motors are therefore designed without integrated fans or fan covers.

In the non-ventilated version, the resulting reduction in nominal motor output must be observed!

Additional modules

HR	Hand wheel
SD	Protection cap
ID	Protection cap for encoders
ZWM	Second shaft end - module shaft
ZWV	Second shaft end - solid shaft

HR - Hand wheel

IEC frame sizes: 71 to 200

By using a second shaft end it is possible to fit a hand wheel.

IEC frame size	ØWD	WH
71	125	51
80	125	51
90	125	51
100	125	51
112	125	51
132	200	60
160	200	60
180	200	60
200	200	60

Dimensions in mm.

SD - Protection cap

IEC frame sizes: 63 to 200

When installed vertically with the shaft downward, e.g. IM V1, the air intake opening can be protected against water and foreign substance by means of a protective cap.

IEC frame size	ØCD	CH
63	124	20
71	139	20
80	157	20
90	176	20
100	197	32

132	254	35
160	266	52
180	310	57
200	380	67

Dimensions in mm.

ID - Protection cap for encoders

IEC frame sizes: 90 to 200

If mounted outside the fan cover, the encoder may be protected against foreign matter and other external influence by a separate protection cap.

Protection cap for	CD	CH
IG standard encoder	74	116
IV Heavy Duty encoder	115	183

Dimensions in mm.

ZW. - Second shaft end

Motors with or without brake can be supplied with a second free shaft end.

ZWM: Module shaft

IEC frame sizes: 71 to 200. This shaft end can be used to transfer half the rated output of the motor.

ZWV: Solid shaft

IEC frame sizes: 63 to 200. Available on request.

IEC frame size	DA	DZ ²⁾	EA	ED	FA	GC
63 ¹⁾	11	M4	23	-	4	12.5

Standards

The motors comply with the competent standards and specifications, especially with the following:

Title	IEC	DIN / EN / VDE
Rotating electrical machines Rating and performance	IEC 60034-1 IEC 60085	DIN EN 60034-1
Standard methods for determining losses and efficiency from tests (excluding machines for traction vehicles)	IEC 60034-2-1	DIN EN 60034-2-1
Degrees of protection provided by integral design of rotating electrical machines (IP Code)	IEC 60034-5	DIN EN 60034-5
Methods of cooling (IC Code)	IEC 60034-6	DIN EN 60034-6
Classification of types of construction, mounting arrangements and terminal box position (IM Code)	IEC 60034-7	DIN EN 60034-7
Terminal markings and direction of rotation	IEC 60034-8	DIN EN 60034-8
Noise limits	IEC 60034-9	DIN EN 60034-9
Starting performance of single-speed three-phase cage induction motors	IEC 60034-12	DIN EN 60034-12
Mechanical vibration of certain machines with shaft heights 56 mm and higher - measurement, evaluation and limits of vibration severity	IEC 60034-14	DIN EN 60034-14
Dimensions and output series for rotating electrical machines	IEC 60072-1	DIN EN 50347
Thermal protection	IEC 60034-11	DIN EN 60034-11
CENELEC standard voltages	IEC 60038	DIN EN 60038

Know More

Excellence to enhance productivity

For us, excellence is to develop products and projects that increase the competitiveness of our customers, with a full range of electrical equipment, efficient and safe machines and clean and sustainable energy. We provide products with high performance and reliability to improve your production process from start to finish.
